What is claimed is:

10

15

1. A noise adaptation system of speech model for adapting a speech model for any noise to speech to be recognized in a noisy environment, said speech model being learned by using clean speech data, said system comprising:

clustering means for clustering noise-added speech;
speech model space generating means for generating a
tree-structure noisy speech model space based on the result
of the clustering performed by said clustering means;

parameter extracting means for extracting a speech feature parameter of input noisy speech to be recognized; selecting means for selecting an optimum model from the tree-structure noisy speech model space generated by said speech model space generating means; and

linear transformation means for applying linear transformation to the model selected by the selecting means so that the model provides a further increased likelihood.

20 2. The noise adaptation system of speech model according to claim 1, wherein said clustering means generates said noise-added speech by adding said noise to said speech in accordance with a signal-to-noise ratio condition, subtracts the mean value of speech cepstral of the generated noise-added speech, generates a Gaussian distribution model of each of pieces of generated noise-added speech, and calculates the

likelihood between the pieces of noise-added speech to generate a likelihood matrix to provide a clustering result.

- 3. The noise adaptation system according to claim 1 or 2, wherein said selecting means selects a model that provides the highest likelihood for the speech feature parameter extracted by said parameter extracting means.
- 4. The noise adaptation system according to claim 3, wherein 10 said selecting means selects a model by searching said tree-structure noisy model space downward from the highest to the lowest level.
- 5. The noise adaptation system according to one of claims
 15 1 to 4, wherein said linear transformation means performs
 the linear transformation on the basis of the model selected
 by said selecting means to increase the likelihood.
- 6. A speech model noise adaptation method for adapting a
 20 speech model for any noise to speech to be recognized in a
 noisy environment, said speech model being learned by using
 clean speech data, said method comprising:
 - a clustering step of clustering noise-added speech;
- a speech model space generating step of generating a

 25 tree-structure noisy speech model space based on the result

 of the clustering performed at said clustering step;

a parameter extracting step of extracting a speech feature parameter of input noisy speech to be recognized;

a selecting step of selecting an optimum model from the tree-structure noisy speech model space generated at said speech model space generating step; and

5

20

25

a linear transformation step of applying linear transformation to the model selected at the selecting step so that the model provides a further increased likelihood.

7. A noise adaptation program for speech recognition that controls a computer to adapt a speech model for any noise to speech to be recognized in a noisy environment, said speech model being learned by using clean speech data, said program comprising:

a clustering step of clustering noise-added speech;

a speech model space generating step of generating a tree-structure noisy speech model space based on the result of the clustering performed at said clustering step;

a parameter extracting step of extracting a speech feature parameter of input noisy speech to be recognized;

a selecting step of selecting an optimum model from the tree-structure noisy speech model space generated at said speech model space generating step; and

a linear transformation step of applying linear transformation to the model selected at the selecting step so that the model provides a further increased likelihood.
